

The new racial classification

by Eduardo Velasco

Editor's Abstract: The European race is divided into three primordial races: the European Nordid White ('White Nordid' or WN), the Nordid Central Asian Redhead ('Red Nordid' or RN), and the Near Eastern Armenid. The white race is actually a mixture of two or more races. We cannot say, 'This person is a pure white' but 'This person has a mixture of A, B and C races in such proportions'. With terms like Aryan or white we designate a mixture between White Nordid and Red Nordid and its mild crossing with non-white 'Armenids' or 'Mongolids'—usually people of Germanic and Slavic origin. Therefore, while the ideal white is a White Nordid with a Red Nordid, we cannot say that those whites who have some Armenid or Mongolid genes are non-whites. However, we could say they are non-whites if they have substantial Armenid and/or Mongolid blood and especially Congid blood.

For the fourteen words, someone who knows how to analyse facial features is more useful than a genetic analyst because the latter's studies do not include detailed racial information.

Physical anthropology became a solid discipline in the 19th century, along with the expansion of the European colonial empires, as part of the natural interest in understanding each race and the will to distinguish one from another, both physically as well as psychologically and socially. Physical anthropology reached its peak

with Anglo-Saxon and German nordicists and eugenicists, especially during the Third Reich. After 1945, physical anthropology became a 'heretical' discipline. It was separated from social anthropology, which was completely taken over by cultural Marxists. Presently, some bio-anthropologists ask for their discipline to be included again as part of the degree in anthropology, turning it into a shared specialty. It is a tricky business, as physical anthropology would end up touching social, psychological and genetic factors, which could take a very politically incorrect turn.

The Old Racial Classification

For decades, following the criteria of German, English and American physical anthropologists, the division of the European sub-races was as follows:

Nordic: high stature, rosy skin, athletic build, straight nose, well-developed chin, dolichocephalic head, fair hair and light eyes.

Dalic or Falic: high stature, robust and heavily built, rosy skin, blond hair, light eyes (blue, grey or green), dolichocephalic or brachycephalic cranium, big mouth and thin lips.

Dinaric: high-medium stature, brown skin, slim build, aquiline nose, brachycephalic, dark hair and eyes.

Alpine: medium stature, fair skin, heavily built, brachycephalic, brown hair, brown or light eyes.

East Baltic: medium to low stature, fair skin, strong build, brachycephalic, light hair and eyes.

Mediterranean: low stature, brown skin, physical constitution varying from gracile to slender, straight nose, regular features, dolichocephalic, dark hair and eyes.

This classification is obsolete. Although those who made it were on the right track, it has been fully improved, as would be expected, after a century. The improvement has been made due to three factors:

(1) The globalisation and technological advances whereby we have easy access to high-quality colour photographs of persons from different ethnic backgrounds worldwide. This is a luxury that physical anthropologists at the beginning of the past century (who had to content themselves with a very limited and black-and-white photographic supply) could hardly dream of. Due to this free access to physiognomic features an update of the old racial classification was bound to occur sooner or later.

(2) The overwhelming advance in genetics in the past years, specifically in human lineages (paternal and maternal) research from ethnic groups worldwide, and their distribution in haplogroups. This research is still advancing steadily (e.g., X-chromosome haplogroups are in the process of being identified).

(3) The monumental investigation made by my contributor Valg in the field of physical anthropology, and its meticulous verification with scientific data provided by genetics (which has gone deeply into the origin of the different human ethnic communities), palaeoanthropology (which studies the physical features of prehistoric men), archaeology and history. Thanks to this ever-progressing work, Valg has been able to separate the current components in modern mixes, isolating the original features and finally going back to the lost primal races. Long before finding photographs of pure specimens, he already had in mind the features he was looking for. This search, which exceeds all previous ones and sets physical anthropology on a solid and new basis, has led him to discover that:

- What yesteryear was called 'Nordic race' is actually a mix of White and Red Nordids with some Armenid and, to a lesser extent, Mongolid influence.

- The 'Mediterranean race' is a mix of Red Nordids, Armenids, White Nordids, Congids in small proportion and sometimes Mongolids in a minimal proportion.

- The 'Dinaric race' is a mix of White Nordids and Armenids, usually with Red Nordid influence.

- The 'Alpine race' is a mix of Red Nordids, Mongolids and, to a lesser extent, White Nordids and Armenids.

- The 'East Baltic race' is a mix of White and Red Nordids, and Mongolids.

- The primal European races are three: the White Nordid, the Red Nordid and the Armenid.

The vast majority of individuals are lacking in ethnical instincts while Western civilisation is undergoing an aggressive invasion and colonisation process that threatens to drown forever its valuable autochthonous genetic diversity. Therefore, I want to make it clear that if I think about these matters it is because I honestly believe they will contribute to strengthening our Western civilisation, our white race and all mankind. This study is about the history of our blood. Those who think we are all equal or that all this is nonsense, are kindly invited not to read any further. We are not interested in

convincing anyone, but in providing the facts whereby free-thinking individuals can convince themselves if they deem it appropriate. Let us now see the racial types that have taken part in the sculpting of what we understand today as the 'white race'.

*Central-Asian Red Nordid race
(henceforth, Red Nordid race or RN)*

This red-haired man, from Southern England, is a pure Red Nordid. Noticeable traits are orange hair, sparse eyebrows, very dark-blue eyes and reddish skin.¹

Nose with a low nasal bridge and a fleshy tip. Squared features, prone to gain body mass. Notice a harder, broader, more robust facial complexion than the White Nordid (described below). If the White Nordid inspires certain serenity, lightness and gracefulness, the RN inspires restlessness, impulsiveness, brutality, aggressiveness and explosive force, as well as a higher tendency to tyranny and abruptness. It is also a more passionate, less agile, less ethereal and denser race than the White Nordid, with a stronger character and temperament, as well as more muscular strength. Presumably higher testosterone levels and more attachment to Nature.

¹ *Note of the editor:* The hard copy of this book lacks coloured photos. In the PDF of this book, available through *The West's Darkest Hour*, the photographs are coloured.

Stature: Medium-low.

Constitution: Massive and compact. Strong and broad bones. Prone to gain body mass (muscle or fat, depending on conditions). Short and powerful legs. Short, strong and wide neck.

Eyes: Wide. Dark navy blue, small pupils, middle distance between the eyes. Big sockets. Straight, horizontal, very sparse and almost white eyebrows. Less pronounced supraorbital arches than White Nordids.

Nose: Shorter, wider, more rounded and in general, fleshier than the White Nordid. The key of the Red Nordid nose is, in addition to its fleshy tip, that its 'root' is not located between the eyebrows but lower, so that it is 'deep set' between the eyes. The nose has thus a less vertical, lower, more compact, aggressive and forward-projected appearance when looked from the side.

Ears: Thinner and smaller than the White Nordid's.

Mouth: Extremely thin and narrow lips. Narrow philtrum. The outline of the lips is not clearly defined, nor differentiated from the rest of the skin, as in the White Nordid case. Big mouth.

Teeth: Lined-up set of teeth, smaller differences in height and shape than in the White Nordid. When interbreeding with Armenids (described below) the separation between teeth tends to increase. This can be due to the heredity of a big, spacious mouth which cannot be 'filled' by Armenid teeth. Probably C-shaped dental arch.

Hair: Orange, straight. Tends to stand up instead of falling.

Body hair: Medium-scarce, although in mixes with Armenids the hair turns very dense, especially if some conglomeration is added to the mix. Bushy sideburns and goatee.

Skin: In pure RN, the MC1R gene is deactivated, so unlike pure White Nordids they are unable to produce melanin. Very high levels of pheomelanin. Red, rosy and bloody skin. When mixing with other races, the bloody appearance tends to retreat to the face, and on the face itself onto the cheeks, ears and under the eyes. People with a tendency to blush (be it of anger, heat or embarrassment) have RN contributions, as well as a higher risk of skin diseases when exposed to the Sun. This is because they descend from ancestors who rarely received sunlight exposition due to their necessity of protecting themselves from the cold with animal skins.

Skull: Brachycephalic, flattened occipital bone but prominent temporal bones. Larger cranial capacity and broader face than the White Nordid race. The RN has developed its cranial volume forwards (frontal bone) and sideward (temporal bones).

Pure Red Nordids have planoccipital cranium and this, in combination with the width of their temporal bones (temples) makes them the brachycephalic race *par excellence*, responsible for the cranial type previously known as 'Alpine'. They also usually have strong nuchal muscles and tend to accumulate fat around the cervical area.

Face profile: Very vertical, ultra-progressive and very straight (orthognathous, very open-obtuse facial angle), more than the White Nordid race.

Forehead: Very high, straight and vertical. Again, more than in White Nordids.

Jaw & chin: Strong, squared, broad and robust jaw. Prominent and sharp chin which seems to end in a fleshy ball.

Other features: Accelerated metabolism, very active blood circulation. Neoteny: very youthful look, whose freshness is even better preserved than in White Nordids. A tendency to perspiration and sweating.

Higher sensitivity to pain: Redheads usually need more anaesthesia (about 20 percent more, though this can also be due to a faster metabolism) than other races. This fits well with the idea that the RN lost skin pigmentation and toughness by protecting themselves with animal skins, which ended up making their skin tissues look like subcutaneous tissues, losing their hardness. Other studies suggest a higher sensitivity to thermal pain and lower sensitivity to electric pain. Higher lactose and alcohol tolerance than any other race, which would lead us to think that Red Nordids were the first ones to consume milk and alcoholic beverages, as well as cattle meat.

Freckles are not a Red Nordid inheritance, neither are they of any other pure race. They are common in Red Nordids mixed with Armenised White Nordids. We must remember that freckles (as well as spots) are little marks appearing due to higher eumelanin or pheomelanin concentrations. Fair-milky skin, unable to synthesize melanin, does not correspond with a pure racial type either, but with a mix of Red Nordid and White Nordid with a RN predominance.

Armenised RNs have their orange hair darkened, turning to red and then auburn. When mixed with White Nordids they have a sandy, somewhat flaming hair colour.

Green eyes are not an asset of any pure race either, but of mixes: green eyes are actually low-pigmentation brown eyes (the same applies to amber eyes) mixed with grey and blue eyes. Green corresponds to a little active OCA2 gene, while blue and especially grey, are the result of a deactivated OCA2.

Paternal lineages (Y-DNA): R (R1a, related to Slavs and Aryans, and R1b, the predominant haplogroup in Western Europe). R2 is also probably Red Nordid in origin. There is a possibility that all these lineages are Armenid. In such case, other possible candidates to paternal RN lineages are I2b1 and G.

The largest concentrations of R1a haplogroup occur in places like Poland, Ukraine, Belarus and Russia, considered the Urheimat of the Slavic peoples. There is an abrupt decrease in R1a concentration in Serbia and Bulgaria that, despite being of Slavic heritage, came into contact with other tribes (Illyrians, Byzantines, and others; while Thracians and Dacians were probably of I stock) and lived under the Ottoman Empire. The few R1a contributions in Spain may have come along with the Alans and the later Slavic mercenaries employed by the Córdoba Caliphate, as well as with Moors with Persian heritage, at least on their fathers' lines. Another interesting detail is the R1a frequency in countries like Syria or Iran, which were under Persian dominion and therefore received a significant Iranian flow.

Maternal lineages (mtDNA): HV, H, V. Probably not all HV descendants are Red Nordid; many of them can be Armenid. Radiating from Spain, this haplogroup vanishes as we move southwards and eastwards from the Iberian Peninsula.

Spirituality: Connected to Nature. Fire cult. Worship of the spirits of water, air, fire and Earth. Plenty of phallic constructions related to heavenly bodies. This race seems more gifted for esoteric and magic issues than the White Nordid. Gods of the Earth, vegetation, waters, homes and families.

Psychology, idiosyncrasy and racial character: Love for Nature, patriotism, attachment to the homeland, intelligence, impulsiveness, unpredictable personality, prone to fits of fury and sudden uprisings, proclivity to excesses in violent matters but also overwhelming joy. Traditional Western medicine considered redheads as 'blood tempered' individuals, whereas the ancient Indian Ayurvedic medicine describes them as being Pitta types. (Associated with fire, this also proves that ginger hair was not unknown in India and that there were redheads during the Indo-Aryan migration.) Strength, roughness, fierceness—very developed character, individualism, strong temperament, good memory. This is doubtlessly the race of passion, fire, anger, extremism and even some cruelty.

A more noisy and Dionysian personality than the White Nordids, which is one of the reasons why Spaniards usually say that they fit better with the Irish (which have a great Red Nordid heritage) than with populations with a larger cultural and genetic White Nordic imprint that are more serious, like the Englishmen, Germans or Scandinavians. Based on the evidence in archaeological sites and mummies, as well as descriptions of Scottish Picts (which were probably of Red Nordid heritage), it seems this race was inclined toward tattoos (even on the face) and corporal paintings, utilising a blue pigment called woad in Scotland.

Distribution: This race has its purest stronghold in Scotland and Northern England. In Spain, from a physical-anthropological point of view, the purest R1b Red Nordid core is located in Navarre and sub-Pyrenean areas of Aragon. There is not a known pure R1a core as happens with R1b. As a matter of interest, the distribution and abundance of redheads could be vaguely related to blood types O and -Rh, frequent in Western Europe and decreasing the further eastwards we move.

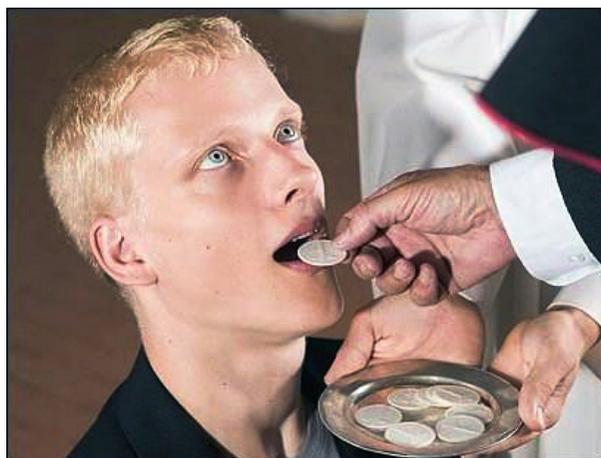

Reflections on the Red Nordid race

The Red Nordid race corresponds to the hefty, short, brachycephalic and ruddy human type. They are known as daring people, with a strong temperament and prone to outbursts and impulses in general. The Red Nordid heritage is well known in Scotland, Ireland, Wales, England, United States, Canada, Norway, Australia and New Zealand. There is much Red Nordid blood in Spain, yet it is rather more diluted than in the previously mentioned places. However, cases of men with reddish shades in the beard are

very common. The same happens in all the Middle East. It can be said that this race constitutes the foundations of the nations of Celtic heritage in Western Europe. The purest Red Nordid core is to be found in the British Isles, Norway, Iceland to a lesser extent and those countries (United States, Canada, Australia, New Zealand) which hosted people coming from these lands.

In present times a racially pure individual is always very striking, no matter which race he belongs to. However, the ones who stand out the most are the pure Red Nordids, with their orange hair, bright red skin, corpulence and incandescent appearance. Significantly, the glacial ices gave rise to a fiery human type.

*European White Nordid race
(henceforth, White Nordid race or WTN)*

Above, a pure White Nordid. Notice his skin is neither pale, nor milky-white, nor rosy or ruddy. It is rather 'golden', in harmony with the hair, and seems suitable to get a moderate tan without getting burned when exposed to sunlight. The forehead is high but not completely vertical. Psychologically, this is a noble, harmonious, serene, serious, patient, well-balanced, martial, honourable, disciplined, efficient and racist race; but also somewhat naïve, too angelic and not very cunning in many ways.

Stature: Very high.

Physical constitution: Slender, athletic. Well-shaped, broad and straight shoulders. Long neck. Although it is a slender physical type, it tends to develop musculature under proper conditions of diet and exercise.

Eyes: Ice-grey, very light, almost whitish. Sky-blue eyes are mixes between the light-grey shade of White Nordids and the dark blue of Red Nordids. This tone, very light grey and near the colour of ice, is the eye colour *par excellence* of a pure White Nordid.

The grey eye colour is most common in Finland, the Baltic countries, Belarus and the European part of Russia. These eyes have even lower levels of melanin than conventional blue eyes, and the optical phenomenon that makes them look grey is the same that makes a cloudy sky look so. Elongated eye shape. Eyes deeply inserted in the face under eyebrows that are low, narrow, moderately bushy and bring a thoughtful and audacious expression and a penetrating, aquiline and intense stare. Large pupils, short-medium distance between eyes. Small eye sockets. Moderately prominent supraorbital arches.

Nose: Narrow, straight, not very fleshy, harmonious. The key of the White Nordid nose is that its 'root' lies very high, almost in the forehead, so that the space between the eyes does not look deeply-set like that of Red Nordids. The White Nordid nose corresponds to the well-known 'Greek profile' of classic statues, except that these present a slight armenisation, revealed by their forehead inclination and a slightly higher nasal bridge.

Ears: Thin, elongated.

Mouth: Thin and dark lips, with a clearly 'sketched' outline. The philtrum (the medial cleft extending from the nose to the upper lip, dividing the moustache in two, also known as infranasal depression) is broad and clearly marked in such a way that the central tips of the upper lip look separated and confer a slight 'fed-up' expression, in the style of classic statues.

The photographed individual has his eyebrows slightly raised. When relaxed, the superciliary arches form a T with the nose. This imaginary T has its horizontal lines turned slightly downwards (something similar to the shape of an arrow pointing upwards).

Teeth: Lined-up set of teeth, hardly much difference between the shapes and heights of each tooth.

Hair: Platinum blonde, almost white, straight, thin and lank. When it grows, it tends to stick to the head.

Body hair: Same colour as hair, very thin and sparse.

Skin: Ivory-white, clean appearance. Pale when no suntan is involved. Low levels of eumelanin and pheomelanin, but the White Nordid race has the MC1R gene activated and the skin is thus able to synthesize melanin. Unlike the Red Nordids this race can get a tan. The White Nordid race is thus adapted to either letting the sunlight penetrate the deeper layers of the skin (winter, pale skin) or restrict its absorption (summer, suntanned) unlike the Red Nordid race, which has undergone a more severe Arctic selection (the real ultra-Nordic race) and has permanently lost the ability to produce melanin.

Skull: Dolichocephalic (long seen from the side, little width, narrow temples) and curvoccipital (highly convex occipital and parietal bones). This race has developed cranial capacity backwards and forwards.

Face profile: Not totally vertical but nearly vertical (forehead and chin scarcely receding). Straight and progressive (orthognathous, straight facial angle). The above photo is not a perfectly caught profile. The individual is somewhat turned backwards and his face is looking slightly upwards; but it is very indicative.²

Jaw & chin: Harmonious and well-developed jaw. The chin is between the prominent and massive type of the Red Nordids and the retracted one of the Armenids, but closer to the RN model.

Other features: Facial features transmitting kindness, benevolence and balance. Neoteny: a very youthful appearance, maintained until a very advanced age (although not as much as the Red Nordids). Pale and golden image. Abundance of athletic and active women, attractive and of great beauty which have resulted in a very high reproductive success of White Nordid maternal lineages. The distribution of White Nordids could be vaguely connected to the A blood type.

Paternal lineages (Y-DNA): I (I1, I1b, I2a, I2b, etc.). Valg believes that the I2 lineages could be Armenid and not White Nordid.

Maternal lineages (mtDNA): U, K. Not all U sub-lineages are White Nordid in origin. We believe many of them (particularly the oldest ones) to be Armenid.

Spirituality: Related to the sky. Worship of ancestors and those fallen in combat. Cults of war and virility. Gods of justice, honour, war and order. Esteem for a short and glorious life which ends with a *mors triumphalis*, triumphant death.

Forehead: Straight, broad and almost vertical.

Psychology, idiosyncrasy and racial character: Love for honour, attachment to order, respect for authority and seniority; warlike and military vocation, courage, altruism, loyalty, racism, heroism, self-control, discipline. Intelligence, thoughtfulness. Highly developed willpower, leaning to sports training. Eagerness to explore.

Also innocent, unable to cheat and useless in diplomacy. This race lacks shrewdness not because it lacks intelligence but due to an 'angelical' way of understanding the world. This makes them vulnerable in a degraded and debased modern society, so that darker and more primitive racial types tend to take advantage of them. This

² *Note of the editor:* The photographed man is not Jewish. In the original article there are other photographs of him wearing liturgical outfits from different religious confessions.

race represents the myth of the unworried and trusting Siegfried and the 'stab in the back' archetype.

Distribution: The White Nordid race has its heartland in the Scandinavian countries, being Southern Sweden the purest core; and also in North America, Oceania, Great Britain, Netherlands, Germany and Poland. However, its heritage can be found in all Europe, North and South America, the Middle East, Southern Asia, Siberia and North Africa.

Brief history: After some mix with Red Nordid and, to a lesser extent, Armenid elements during the Neolithic and the age of metals, the WN race would be present in the great Indo-European invasions and the expansion of patriarchal, aggressive, warlike, solar and 'Olympic' cultures. As a redoubt of the original European hunter-gatherer heritage, there remained a White Nordid pocket in Germania and Scandinavia (not counting communities in other regions as the Balkans or the Canary Islands) wherein the Cro-Magnon human type stayed essentially unaltered until relatively recent times. We accept that the Germans of the Roman period, as described by Tacitus in *Germania*, were still pure or almost pure White Nordids, since according to the author:

For my part, I agree with those who think that the tribes of Germany are free from all taint of intermarriages with foreign nations, and that they appear as a distinct, unmixed race, like none but themselves. Hence, too, the same physical peculiarities appear throughout so vast a population. All have fierce blue eyes, fair hair, and huge frames, fit only for a sudden exertion. [*Germania*, IV]

Their descendants crossed with Red Nordids and Armenids (and to a minor extent also Mongolids and Congids), giving rise to the modern Germanic populations, mostly brown-haired. Nowadays there are no hundred percent pure White Nordid blood cores. The only option in this regard would be biopolitics, biosocial engineering, and a positive eugenics program to rescue the hereditary information that remains, hidden and badly combined, in the genetic pool of the modern 'white race'.

Present context. Among all original human races the WN is the one that has at present larger quantities of comparatively pure individuals, partly because it is probably the youngest race, and partly because historically it has displayed more racism than other races. Although it is extremely hard to find highly pure White Nordids (the photographs we use as examples are real jewels of physical

anthropology), the purest individuals and the largest proportion of them are to be found in Southern Sweden and south-Eastern areas of Norway, which matches roughly the distribution of the I1 haplogroup. However, numerically, we find more White Nordid blood in the United States, Canada, Australia, New Zealand, Holland, Great Britain, Germany and some countries of Eastern Europe like Poland, Belarus, Russia, Lithuania, Ukraine and others. Such people descend almost always from relatively recent Germanic waves, as the Barbarians, Anglo-Saxons, Vikings and Normans.

Reflections on the White Nordid race

The White Nordid race, even before being identified as such, has been taken in many cases (the classical era, the Renaissance, neoclassicism, German Nazism) as a prototype and an ideal goal to achieve.

Undoubtedly, the White Nordid Cro-Magnon had territorial conflicts with reproductive communities of other races. The first race they came into conflict with was the Neanderthal, which had been around in the European continent for 200,000 years and had evolved from earlier populations, such as *Homo heidelbergensis*. The theory of extinction by climate change of the Neanderthal is very feeble. Neanderthals had already survived climate change—the Riss-Würm interglacial period—and they became extinct in the middle of the ice age, sixteen millennia before the deglaciation. Their sudden disappearance suggests that both races waged an arm-wrestle (something completely normal in Nature when two different groups compete for the same territory) in which finally the Cro-Magnon triumphed.

Below, two great human races³ that undertook a real duel of titans on European soil. The Neanderthal (left) had been in Europe for 200,000 years. He had overcome both glacial and interglacial periods successfully and occupied a territory spanning from Portugal to Central Asia.

³ *Note of the editor:* Neanderthals weren't human but apes. Their larger cranial capacity in the occipital region is due to the fact that they developed much larger eyes than our ancestors for hunting at night. The cranial elongation is due to the corresponding brain area for decoding that sensory input. See *Them & Us* by Danny Vandramini, one of the experts on the subject who believe that the Cro-Magnons exterminated the Neanderthals.

Despite his fabulous environmental adaptation, when Cro-Magnon (right) showed up it took the Neanderthal only a few millennia to become extinct, suggesting that Cro-Magnon set very high standards in the territorial struggle.

*Near East Armenid race
(henceforth, Armenid race)*

The individual of the illustration, an ethnic Armenian from Syria, is a pure Armenid. The German anthropologist Hans F. K. Günther bequeathed us (*Rassenkunden Europas*) this exceptional photograph of a human type he called 'Armenoid' or 'Hither-Eastern' that Valg prefers to call 'pure Dinaric'. Wedged profile shape, receding forehead, huge nose with a very high nasal bridge (almost at the eyebrow's height), weak jaw, receding chin, dolichocephalic, high cranial vault, gracile physical constitution.

This type is opportunistic, astute, dreamer, nervous and calculating. In Europe, such pure types probably no longer exist (certain regions in the Balkans and Italy would be the purest

European cores), but the great majority of us are ‘Armenised’ to some extent.

Stature: Medium-low.

Constitution: Slim, gracile. Resistant to scarcity. Extremely fibrous, lean and vascular.

Eyes: Brown, medium-sized pupil, short distance between eyes.

Nose: Big, tall, aquiline, narrow, sharp arch.

One theory is that natural selection shaped this race’s nose to dampen the dry desert air before introducing it in the lungs, while another valid theory is that they developed larger nasal passages to increase oxygen intake in a mountainous environment with rarefied air. The latter is more probable since during the last glaciation the Near East was not a desert zone. We thus see that the big and aquiline nose is not exclusively Jewish or Semitic. Due to armenisation and independently of its origin, the typical Semitic ‘hooked’ nose is wider and fleshier due to RN and Congid influence. Were it not for the influence of the Armenid aquiline nose, many Mediterranean types of Southern Europe would have snub Congid-like noses.

Ears: Large. More elongated and rounded than either Nordic varieties. A tendency to stick out.

Teeth: Small mouth, narrow set of teeth and irregular outline (differences in heights and shapes of each tooth). Probably the shape of the bite or dental arch tends to look like a V.

Hair: Black, thick, bushy, and straight-wavy, probably quite greasy. Curly hair is due to Congid influences. A tendency to receding hairlines on the top corners of the forehead.

Body hair: Very bushy moustache.

Skin: Light brown. Clean and uniform appearance. MC1R gene active, a tendency to suntan.

Skull: Armenid-type dolichocephalism. Higher and more vertically-oriented curvoccipitally than that of White Nordids, it is the typical dolichocephalism of the ‘gracile Mediterranean’ type. Very high cranial vault. This race has developed cranial capacity upwards and backwards.

Below, Egyptian Pharaohs Ramses II and Seti II. Despite having other racial influences (for instance, Ramses was a redhead), they can be described as belonging to the Armenid racial base. They display the typical elevated Armenid curvoccipitally that makes the neck look longer.

Face profile: Shape of a wedge with its tip at the nose. Rat- or shark-like profile, primitive-ish. Forward projection of central parts of the face (nose) and receding peripheral parts of the face (chin, forehead, but also regions in the horizontal axis, like cheekbones and zygomatic arches). If the Armenid face is placed looking upwards, the shape would be similar to that of a cone with its apex on the nose tip. For this reason, the Armenid wedged shape cannot only be seen from a lateral view, but also when looked from above or below. Long face when seen from the side (great distance between nose and ear in the profile view). The facial angle is closed and acuter, and the vertical straight line has turned into an ‘aerodynamic’ wedge. In some ways, this race inherited the subnasal prognatism of former hominids, but the centre of maximum frontal projection (the angle’s vertex) is raised from the teeth to the tip of the nose, becoming nasal prognatism.

Armenisation manifests itself through a wedged profile, or in scattered traits such as receding forehead or chin, protruding nose, and an inverted-triangle shape of the lower half of the face (from a frontal view). Thin, sharp bony faces, jaws with the shape of an inverted triangle, are Armenid heritage. It is frequent in China, where the most characteristic Armenid features (like the nose) are blurred by mongolisation (the Armenid and Mongolid races are somewhat opposite morphologically and tend to ‘cancel out’ each other). This is consistent with the fact that the paternal O lineage, probably an Armenid haplogroup, is predominant in China.

Forehead: Receding (sloping backwards).

Jaw & chin: Thin, small with the shape of an inverted triangle when seen from a front view. Weak and receding chin.

Other features: ‘Aerodynamic’ face not only at the vertical axis but also at the horizontal one. Central facial parts projected forwards (with zenith at the nose), receding peripheral parts. Sharp, edged, dry, hard and bony facial features.

Paternal lineages (Y-DNA): F, G, H, J, K, L, M, N, O, P, Q, S, T. There are particular doubts about the racial affiliation of the LT and MS

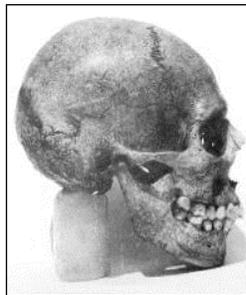

branches, which could be different races derived from the Armenid though not yet identified. Valg has also noted a lacuna in the J lineages because Yemen, the zone where these haplogroups reach their highest frequency, is not a particularly Armenised region; but there is an RN or pseudo-RN influence. If it were so, it could be a link between the RN and WN races.

Maternal lineages (mtDNA): A, B, F, I, J, N, P, Q, R, S, T, X, Y. It will be noticed that, in Europe, Armenid maternal lineages are more common than paternal ones.

Spirituality: Related to the Earth and home. Cult to a long and prosperous life. A tendency to asceticism. Fanaticism, intransigence, human sacrifices.

Psychology, idiosyncrasy and racial character: Liking for personal benefit, love for short-term utility, astuteness and shrewdness. Calculating character, predisposition to materialistic intelligence, commerce, diplomacy and search for personal advantages. Easiness to prejudge people; ability to detect an individual's weaknesses. In civilised multiracial societies, slave trade, white slave trade, smuggling, piracy, legal and illicit business, organised crime.

Distribution: This race, mixed as it is, was immensely prolific and successful, being extended all over Europe, North Africa and from the Near East to India and beyond. The purest cores correspond to the greater-Armenian sphere, the Caucasus, Syria, the Balkans and Italy.

Above, an early Minoan cranium, Greece, circa 2500 BC. Although it is risky to draw racial contributions and this is not a pure specimen, this cranium presents a high cranial vault, receding forehead, a high and protruding nasal bridge and Armenid curvoccipitaly. In North Africa, Armenids produced the 'Moorish' type by interbreeding with Red Nordids and especially Congids, while the further we move eastward, the less Congid influence is found and the more other races (Mongolid, Australid) are present. Nowadays

there is Armenid blood in almost all Eurasia, North, East and even Central Africa, and also in pre-Columbian America (noses that are not Mongolid at all can be observed in many Native Americans).

Present context: Being an older race than any of the Nordid ones, it is extremely difficult to find pure Armenids as they have had more time to crossbreed, and might have been less racist by nature. The Armenid heritage is what gives typical Semites their large noses and receding foreheads. But what we understand as Semitic is usually an individual with more Red Nordid than Armenid contributions.

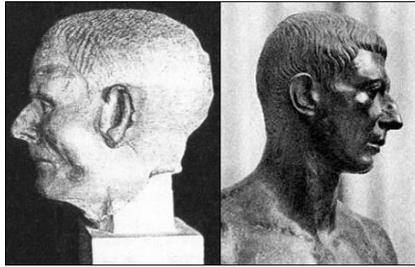

Reflections on the Armenid race

It is easy for the Armenid race to fall into stereotypes and misinterpretations, so we must provide some information to place them in the right place. First, the Semitic label must be avoided. It is tempting to link the Armenid race with Jews, Arabs, Judaism, Christianity, Islam and gypsies, thus identifying them with historical trends that have traditionally acted against the Paleolithic genetic legacy accumulated in the European continent. This is an oversimplification. Those historical forces did indeed renew the Armenid flow towards Europe, and they originated in a region with a predominance of Armenid paternal lineages, yet they were not born in pure Armenid cores, but rather in areas where civilisation had been deeply-rooted for a long time (ergo, regions of ethnic chaos): where Red Nordid and Congid influence was very important, and where intolerant creeds were necessary to unite human masses who otherwise lacked ethnic cohesion.

The Armenid race has played a major role and has been present in all civilisations. It can be said without exaggeration that the Armenid race has been present in all human civilisations. The great mass of ancient Egyptian population belonged to the T lineage, and even the Pharaohs, among whom Red Nordid contributions were important (abundance of blonds and redheads, Tutankhamen R1b paternal lineage), were also strongly Armenised.

As of Rome, there was such a strong armenisation (Cato the Younger, Julius Caesar) that individuals of a very pure Armenid stock could be found in Italy during the rise of Rome. The dominant racial contribution among the Roman ruling caste was Red Nordid, followed by some White Nordid (more apparent in individuals such as Vipsanius Agrippa or Caesar Augustus). The Roman populace must have had higher Armenid contributions. As evidence that the

Armenid blood was strongly represented among the influential class, we have the bust of a Patrician (left) and Cato the Younger (right) on the illustration.

It must be remembered that Cato had plebeian ancestors. This entails that during this period there must have been very pure Armenids in certain regions of Italy, and that within the legions (whose combat tactics weren't different from the Sumerians) much Armenid blood must have been present.

General reflections

Primitive races feel sexually attracted to modern ones: a threat to evolution. Primitive races have an instilled instinct to procreate with the modern ones. This has been translated into millions of rapes and kidnaps of European women, including the unprecedented rape epidemics suffered today due to mass immigration in Europe and Oceania, and to the integration in North America and South Africa. The behavior of the primitives responds to the instinctive desire to improve the genetic code without evolution; that is, without the lengthy effort of undergoing a severe natural selection. It also responds to indiscriminate sexuality, developed to compensate with numerical quantity a lesser individual quality.

As to the debasement of white women there are numerous and illustrative examples, such as the Huns, Mongols, Turks, Tatars or Bolshevism. Another oriental occupation—Jewry—has behaved in a similar way in the western world through pornography, social politics, white slave trade, nightclubs, the fashion industry, music and subliminal propaganda. The purpose is turning the European woman into a commercial product and open her to the capitalist market, 'globalizing' her. This behaviour is understood when taking into account the desires of primitive races for enslaving the modern ones,

acting in a vampirical manner over their genetics and obtaining economic benefits in the process. The genetic code is not improved by this kind of attacks on Nature. The mongrels would only benefit the most primitive race, whereas the noble becomes debased.

The Nordids can only expect a backward leap of dozens of millennia in the evolution of their genetic code—and traumatising their genome forever if they crossbreed with other reproductive communities. If we consider how innocent and carefree modern races are (self-confidence in one's capability tends to relax defences against much shrewder races), we are faced with a serious threat of human devolution.

It is necessary to regenerate the genetic heritage of the West to avoid the biological collapse of mankind. Embryo selection, eugenics and genetic engineering could be fabulous tools to regenerate the white race, but for this to happen we must first defeat the anti-evolutionary, dysgenic selection and egalitarian obscurantism of the mass media manipulated by international finance. International finance is not concerned with evolution but with corrupting everything noble and pure, and burying it in the rotten matter of inferior world order. Civilisation must not exist to promote the development of culture, technology, luxury or comfort but to promote the development of man himself: the evolution of the genetic code. For civilisation depends on genes, not the other way round. It is ridiculous that civilisation turns against the genetic heritage that created it, like a snake that bites its tail.

As a final reflection it may be remembered that I mentioned other racial contributions in Europe. We will pay attention to the rest of the branches of the human tree in a future article, and we will see to what point there are small quantities of Mongolid and Congid traits in the heritage of many Europeans considered perfectly white and even Nordic. This article is incomplete without its second part. Until we learn how to distinguish the contributions of the Khoisanid, Pygmid, Congid and Australid, our thesis will be incomplete. All human lineages are interwoven in such a way that understanding one helps to understand the rest.

Photographic samples

The fact that these racial types barely appear in a pure state and only in very restricted areas, can make racial facts difficult to understand for anyone lacking a properly trained vision. Indeed, most modern Europeans have traits from two or three, if not more, racial types and only good anthropological knowledge, together with a certain personal intuition, can help to read racial stratifications.

—Adriano Romualdi

Analysing features from a racial perspective is not a theoretical issue, but rather a practical one in a visual way. It is all about gaining a racial sensitivity towards facial traits, developing a natural and instinctive suspicion, and deciphering a sort of universal code embedded in the appearance of the peoples, especially the facial features. Someone who knows how to analyse facial traits can be almost as good on the genetic analysis or even more, as up to this date genetic analyses do not include detailed racial information.

The way to improve skills in the racial analysis of human physiognomy is to carefully examine countless human portraits and everyday faces; if possible, from persons with a strong ‘racial personality’, and to make the most out of it. To identify human races, Valg studied hundreds of thousands of portraits from ethnic groups worldwide for years, paying attention to traits inherited from relatives and to the most insignificant details. He did it in such a way that, before finding portraits of pure specimens, he already knew perfectly the sort of features he was looking for as he had mentally isolated them.

It is extremely hard to find pure specimens from various races, but we need to recognise different races even if they are diluted. It is necessary to learn how to identify an Armenised forehead or nose, the strong chin of Red Nordids, the piercing stare of White Nordids, the dark skin and protruding mouth of Congids, the prominent cheekbones and slanted eyes of Mongolids and Khoisanids, etcetera. In this section ‘easy’ examples will be provided of individuals with a strong racial personality, easy to identify without much effort. They

are unusual racial types, not to be found every day on the streets, but the obviousness of their traits makes them suitable to start practising the new physical anthropology. In future articles I will use more common, and thus harder to decipher, examples as well as 'white' individuals with non-'Caucasian' influences. Whoever has an interesting portrait can share it in an e-mail to me. If it is representative enough it might be added to a future article.

We can't say 'this individual belongs to X race', but rather 'this individual has a mixture of X, Y and Z in such proportions'. Also, it will be noticed that even those racial types traditionally deemed pure are contaminated to a lesser or greater extent. Presently blood is so mixed that only an in-depth genetic job could clean each mixture. Nevertheless, this does not mean that 'We are all mongrels', for there are highly different mixtures and proportions. Think about the extraordinary morphological diversity of the individuals photographed in the next pages. According to the official version, all of them are 'Caucasian' and belong to the same 'white race'.

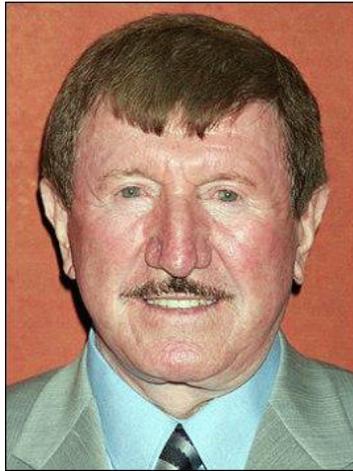

1- This impressive individual from Denmark is a highly predominant Red Nordid. However, his eyes are not perfectly inserted in their sockets, his superciliary arches have become slightly deformed due to racial mixing and his skull, though broad at temple height, gets narrower towards the top: White Nordid and Mongolid influence, though very residual.

2- Interesting highly Armenid individual with WN admixture. Extremely residual congisation and redisation. He is most probably from the Balkans or the Armenian and sub-Armenian regions of the Near East.

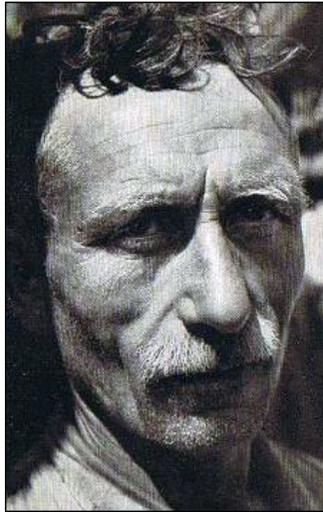

3- Swedish athlete Carolina Klüft is a highly pure White Nordid, though she has slight armenisation and redisation. Her eyes are mixed: pictures reveal them as being mottled with grey as well as navy blue.

4- Basque singer Germán Lizárraga is an interesting admixture of highly predominant RN, some WN, Armenid and residual mongolisation.

5- Russian Alexander Godunov, a White Nordid with hardly any Armenid contribution. Very slight RN influence. Some extremely residual component of another race.

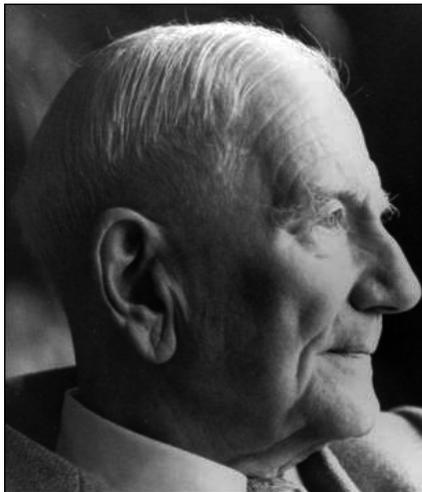

6- A rather balanced mixture of WN, RN and Armenid, with a predominance of the Armenid part.

7- Prominent nose, receding forehead, receding chin, 'aerodynamic' profile and ruddy skin: this man is mainly Armenid, with some RN and, to a lesser extent, WN blood. As a marginal observation, it is curious how men with a strong Armenid influence tend to grow moustaches which are especially bushy.

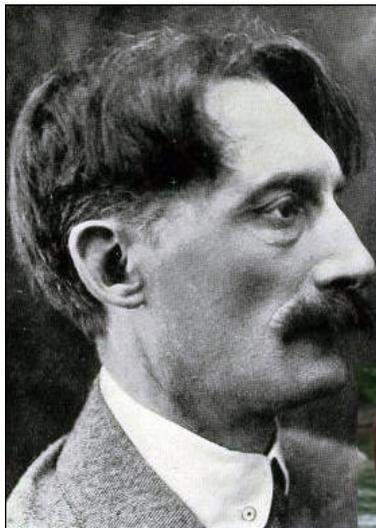

8- Peasant from Northern Friesland. Predominantly White Nordid with some Red Nordid contribution. Very slight armenisation.

9- Armenised White Nordid, or whitened Armenid. Slight RN contributions.

10- This Englishman is Red Nordid, but not perfect (not completely red, skin tends to be paler and he has freckles). Observe the navy-blue colour of his eyes. A lateral view could tell us more. Extremely residual influences of mongolisation, armenisation and 'whitisation'.

11- Highly Armenid. WN and RN admixture. Probably very slight mongolisation.

12- This German woman is a White Nordid with some armenisation (nose), slight mongolisation (eyes) and slight redisation.

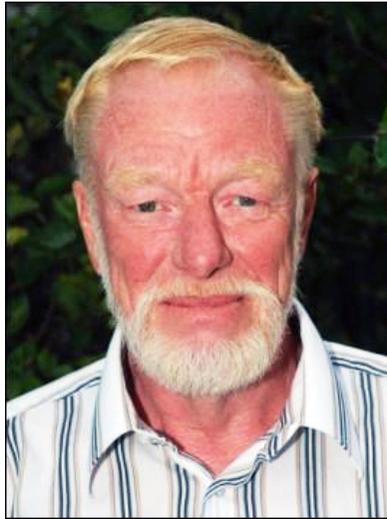

13- Red Nordid with White Nordid, very slight armenisation and residual mongolisation. Eyes are of RN heritage (dark blue, small pupil). Notice that this kind of mixture is mainly found in Anglo-Saxon countries.

14- German football player Ramelow. Despite his pure hair colour and his clean features, he has some armenisation (forehead, chin and other features). Residual RN influence, extremely slight mongolisation. Otherwise, a very pure White Nordid for our times.

15- This Italian is a RN and Armenid mixture, with fewer Armenid and more RN than example No. 7. Small WN influence. His red side is manifested in the brown-reddish hair and beard, the rosy skin tending to have freckles, whereas the Armenid part is clear in his forehead, nose, curvoccipitaly and in general, in his 'aerodynamic' profile.

16- Highly RN. Slanted eyes: clear mongolisation. Very residual whitisation. No armenisation.

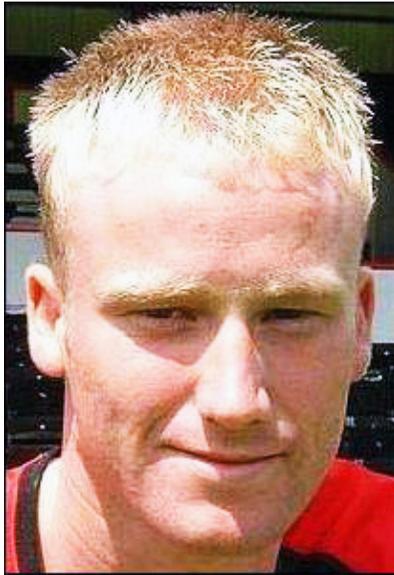

17- English athlete Iwan Thomas. Highly White Nordid. Slight redisation, visible in the jaw, chin, shape of superciliary arches and freckles, upper chest and arms. Residual armenisation. Residual mongolisation.

18- This Swede is a highly predominant Red Nordid (jaw and chin, facial shape, mouth, dark-blue eyes, fleshy nose, rosy skin), yet with some WN influence in the skin and hair colour, and the eyes' outline. Abundant type of mixture from Anglo-Saxon, German and, to a lesser extent, Slavic countries.

19- Highly Armenid Italian. RN influence manifested in freckles, jaw and a nose with a lower root than what would be normal in a pure Armenid.

20- English football player Danny Clay. Red Nordid, high White Nordid influence. Residual mongolisation and armenisation.

21- Highly Red Nordid but significant Armenid influence. It would be interesting to see a side view.

22- Swedish model Carolina Winberg. Very White Nordid. Slight RN influences. In her profile photos her forehead is so vertical it almost seems to form an inverted, 'negative' angle. The jaw zone is redicised. Freckles. Very light mongolisation. No armenisation at all.

23- Highly Red Nordid Norwegian. Armenid and Mongolid influence.

24- White Nordid with an obvious armenisation (observe facial angle). Also residual mongolisation.

25- American comedian Darren Marlar. Highly predominant RN, with Armenid, WN and Mongolid contributions.

26- Welsh singer Rhydian Roberts. Highly WN, with a slight redisation and a residual mongolisation. As a matter of interest, and despite how slight his RN admixture is, Rhydian was ginger-haired as a child and his chest hair is still reddish.

27- White Nordid and Red Nordid with armenisation. As a possibility, extremely residual congisation. Interesting to see how his hair tends to the WN colour and his beard to the Red Nordid.

28- Canadian actor Zack Ward. Predominantly RN with WN, Mongolid and Armenid contributions.

29- Mongolised Red Nordid.

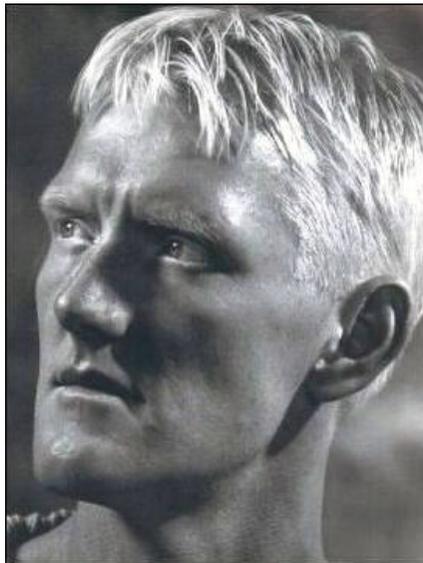

30- This Albanian football player is WN/RN with armenisation and mongolisation. Notice the very wide philtrum and the characteristic shape of the upper lip (WN influence).

31- Red Nordid and WN admixture, with a clear predominance of the RN element. Possible extremely residual armenisation.

32- Girl from the Kalash ethnic group (Northern Pakistan). Strongly White Nordid, slight Mongoloid admixture. Residual armenisation. Her purity is astonishing taking into account the region she is from.

33- White Nordid with some RN. Very residual armenisation and mongolisation.

34- Chris J. Evans, English radio and TV host and producer. Highly RN with WN contributions but, compared to the above photo, his mongolisation and especially his armenisation are obvious. (The hair colour is not to mislead us, as it is an isolated feature and his eyebrows and sideburns are reddish.)

35- Spencer Wells, American geneticist and anthropologist. Red Nordid with White Nordid. Not much armenisation. Residual mongolisation.

36- Highly Armenid young individual from Kiakhta, Kurdistan. Residual WN and Congid contributions.

For the context of this article, which appeared in 2009 on the Spanish website *Europa Soberana*, see the appendix to the anthology *The Fair Race's Darkest Hour*, the PDF of which is available at:
